Click Fraud When a computer clicks a link or button that is out of place or that the computer is not authorized to click, this is called click fraud, and is the most common type of click fraud. In one study, the author of the study found that the click fraud rate for Google Adwords is between one and two per cent. To estimate the prevalence of click fraud in other ad networks, we refer to the rate found in the study as well as the range of the prevalence of other types of click fraud as reported in other studies. Like spam, click fraud can potentially cost advertisers money, but not only by paying for clicks but also by paying for impressions that advertisers don't pay for. According to one estimate, the average profit margin for each click that a click fraudster can purchase is around \$0.20. Cookie Detection Cookie detection technology is aimed at detecting a computer that is using a number of different web sites or pages from a single computer, or a computer that is using a browser multiple times from a single IP address. In contrast to other types of click fraud, the cookie detector should never pay for any clicks that it detects. If a computer pays for clicks fraudulently, the advertiser will be charged. In many cases, it is not possible to differentiate between a computer using a browser multiple times from a computer that is using the browser once from a single IP address, as both computers use a single computer and a single IP address for their browsing. Therefore, we will not consider

---

cookies as a detection technology, because they can't stop fraud. Advanced Click Fraud Advanced click fraud is click fraud that the advertiser does not see, or that the advertiser cannot detect by the tools that advertisers use to detect click fraud. By this we mean that the advertiser is not aware that the computer that has clicked on an ad is using a browser multiple times, or that the computer has clicked on a link that does not lead to an ad. Some of the possible advanced fraud techniques include using a browser plug-in, or using a proxy server. If an advanced click fraud technique is detected, and the advertiser can prove that it is not the computer that has clicked, then the advertiser will be charged for the clicks fraudulently used. A Typical Online Click Fraud Scheme Click fraud can be performed by, and by definition involves, a third party. In contrast to spam, where the cost of sending 82157476af
